

The new **Johnson™** Handle is designed for "pre-connect" applications where a quick change from Combination Nozzle to Piercing Tip or Wand is desired. This new handle is 100% corrosion resistant and is designed for the rigors of "pre-connect" usage. It is the first device of its type on the market, and it will have a great impact on the way that a penetrating nozzle is used by a firefighter.

The Combination Nozzle Adapter is designed for adapting your current Combo Nozzle to the **Johnson™** "Quick Disconnect" system. When combined with the new **Johnson™** Handle, it gives the firefighter the ability to convert from fog to straight stream, to piercing, to penetrating fogging, or to pencil stream in just a few seconds and it has a built in stream shaper.

“Adapts to any breakdown nozzle”

*" This just might be the perfect nozzle set-up for your department"*

**WaterLance™** products use engineered nozzle designs that provide 100gpm flow rates @ 125psi while giving 28-foot diameter half-round fogging patterns. We have doubled the water circle, greatly improved fogging, reduced the weight and dramatically improved ergonomics over previous designs. In addition, the **WaterLance™** products have been designed as a complete modular unit, which breaks down for easy storage and increased flexibility.
